N Method for the Continuous Problem Formulation of the Domain Decomposition

We consider the PDE problem

$$Lu = f \text{ in } \Omega, \quad u = g \text{ on } \partial\Omega$$
 (1)

domain with piecewise smooth boundary $\partial\Omega$. Assume that Ω is split into k open subdomains Ω_i , $i=1,\ldots,k$, such that $\overline{\Omega}=\cup_{i=1}^k\overline{\Omega}_i$, $\Omega_i\cap\Omega_j=\emptyset$ and $\partial\Omega\cap\partial\Omega_i\neq\emptyset$, $i,j=1,\ldots,k$. For reasons related either to the characteristics use the fact that the operator L acts on the interface while the second one subsequently we present the corresponding iterative schemes. They both use replace (1) with a system of similar problems defined on the subdomains Ω_i . of this problem or to the computing resources available one would like to Dirichlet boundary conditions on the interfaces. The first approach does not (see [11]). From them we select one, consider two different approaches and There are many ways to realize the coupling of the problems in this system $f \in L^2(\Omega)$ while $g \in H^{\frac{1}{2}}(\partial\Omega)$, where $\Omega \subset R^d$, $d = 1, 2, \ldots$, is an open convex where L is a second order elliptic differential operator, f, g are such that

2.1 The First Scheme

equivalent to the following split problem mains by $\Gamma = \partial \Omega_1 \cap \partial \Omega_2$. Under certain conditions the original problem is For simplicity we choose k=2 and denote the interface of the two subdo-

$$Lu_1 = f \quad \text{in} \quad \Omega_1 \qquad \qquad Lu_2 = f \quad \text{in} \quad \Omega_2$$

$$u_1 = g \quad \text{on} \quad \partial\Omega \cap \partial\Omega_1 \qquad \qquad u_2 = g \quad \text{on} \quad \partial\Omega \cap \partial\Omega_2$$

$$u_1 = u_2 \quad \text{on} \quad \Gamma$$

$$\frac{\partial u_1}{\partial \nu^1} + \frac{\partial u_2}{\partial \nu^2} = 0 \quad \text{on} \quad \Gamma$$

$$\frac{\partial u_2}{\partial \nu^2} + \frac{\partial u_1}{\partial \nu^1} = 0 \quad \text{on} \quad \Gamma$$

where for n = 1, 2, $u_n = u \mid_{\Omega_n}$ and where ν^n is the outward unit normal vector to $\partial\Omega_n$.

arbitrarily choose $u_n^{(0)} \in H^1(\Omega_n)$ with $u_n^{(0)} \mid_{\partial \Omega \cap \partial \Omega_n} = g$ and, for $i = 0, 1, 2, \ldots$, construct the sequence $u_n^{(i+1)} \in H^1(\Omega_n)$ with $u_n^{(i+1)} \mid_{\partial \Omega \cap \partial \Omega_n} = g$, n = 1, 2, This allows us to define the following domain decomposition method. We

$$Lu_{1}^{(2i+1)} = f \text{ in } \Omega_{1}, \quad u_{1}^{(2i+1)} = bu_{1}^{(2i)} + (1-b)u_{2}^{(2i)} \text{ on } \Gamma$$

$$Lu_{2}^{(2i+1)} = f \text{ in } \Omega_{2}, \quad u_{2}^{(2i+1)} = (1-b)u_{1}^{(2i)} + bu_{2}^{(2i)} \text{ on } \Gamma$$

$$Lu_{1}^{(2i+2)} = f \text{ in } \Omega_{1}, \quad \frac{\partial u_{1}^{(2i+2)}}{\partial \nu^{1}} = a\frac{\partial u_{1}^{(2i+1)}}{\partial \nu^{1}} + (1-a)\frac{\partial u_{2}^{(2i+1)}}{\partial \nu^{1}} \text{ on } \Gamma$$

$$Lu_{2}^{(2i+2)} = f \text{ in } \Omega_{2}, \quad \frac{\partial u_{2}^{(2i+2)}}{\partial \nu^{2}} = (1-a)\frac{\partial u_{1}^{(2i+1)}}{\partial \nu^{2}} + a\frac{\partial u_{2}^{(2i+1)}}{\partial \nu^{2}} \text{ on } \Gamma$$

where a, b are relaxation parameters to be determined later.

2.2 The Second Scheme

 $\Gamma = \partial \Omega_1 \cap \partial \Omega_2$. This time the split problem is Again we choose k=2 and denote the interface of the two subdomains by

$$Lu_1 = f \quad \text{in} \quad \Omega_1 \cup \Gamma$$

$$u_1 = g \quad \text{on} \quad \partial\Omega \cap \partial\Omega_1$$

$$u_2 = g \quad \text{on} \quad \partial\Omega \cap \partial\Omega_2$$

$$u_1 = u_2 \quad \text{on} \quad \Gamma$$

$$\frac{\partial u_1}{\partial \nu^2} + \frac{\partial u_2}{\partial \nu^2} = 0 \quad \text{on} \quad \Gamma$$

$$\frac{\partial u_2}{\partial \nu^2} + \frac{\partial u_1}{\partial \nu^2} = 0 \quad \text{on} \quad \Gamma$$

vector to $\partial\Omega_n$. where for $n=1,2, u_n=u \mid_{\Omega_n}$ and where ν^n is the outward unit normal

interface Γ as well. one because operator L acts not only on domains Ω_1 and Ω_2 but on the As we have already mentioned, this second approach differs from the first

In the corresponding domain decomposition method we arbitrarily choose $u_n^{(0)} \in H^1(\Omega_n)$ with $u_n^{(0)} \mid_{\partial\Omega\cap\partial\Omega_n} = g$ and, for $i = 0, 1, 2, \ldots$, construct the sequence $u_n^{(i+1)} \in H^1(\Omega_n)$ with $u_n^{(i+1)} \mid_{\partial\Omega\cap\partial\Omega_n} = g$, n = 1, 2, satisfying

$$Lu_{1}^{(2i+1)} = f \text{ in } \Omega_{1} \cup \Gamma, \qquad u_{1}^{(2i+1)} = bu_{1}^{(2i)} + (1-b)u_{2}^{(2i)} \text{ on } \Gamma$$

$$Lu_{2}^{(2i+1)} = f \text{ in } \Omega_{2} \cup \Gamma, \qquad u_{2}^{(2i+1)} = (1-b)u_{1}^{(2i)} + bu_{2}^{(2i)} \text{ on } \Gamma$$

$$Lu_{1}^{(2i+2)} = f \text{ in } \Omega_{1} \cup \Gamma, \qquad \frac{\partial u_{1}^{(2i+2)}}{\partial \nu^{1}} = a\frac{\partial u_{1}^{(2i+1)}}{\partial \nu^{1}} + (1-a)\frac{\partial u_{2}^{(2i+1)}}{\partial \nu^{1}} \text{ on } \Gamma$$

$$Lu_{2}^{(2i+2)} = f \text{ in } \Omega_{2} \cup \Gamma, \qquad \frac{\partial u_{2}^{(2i+2)}}{\partial \nu^{2}} = (1-a)\frac{\partial u_{1}^{(2i+1)}}{\partial \nu^{2}} + a\frac{\partial u_{2}^{(2i+1)}}{\partial \nu^{2}} \text{ on } \Gamma$$

where a, b are relaxation parameters to be determined.

original PDE problem; in other words, to make the errors vanish asymptoti-PDE level see e.g., [11]. determined from the continuous problem(s). For convergence results at the produced is (are) solved by using as values for the parameters a, b the ones they discretize the (continuous) PDE problem(s) and the linear system(s) that make the scheme converge asymptotically as fast as possible. Then, cally along the interface and also to determine those (optimal) values of a, bposed produces a sequence of solutions that converges to the solution of the they try to determine values for the parameters a, b so that the scheme pro-Most researchers work at the differential equation level. This means that

at hand converge and if possible converge in an optimal sense. In general such a way as to make the iterative scheme that solves the linear system methods are used to approximate the PDE problem and subproblems. Folmains are defined and then finite difference, finite element or even collocation of the inherent difficulties the solution to the corresponding linear problem difficult problem. the determination of the parameters a, b this time constitutes a much more the problem this time is to determine the values of the parameters a, b in to the linear system is found by means of an analogous iterative scheme. So lowing exactly the same idea as the one in the continuous case, the solution presents. In this case, first the entire domain is discretized, next the subdobe found in the literature (see e.g. [7], [8], [15], [16], etc.). This is because On the other hand, very few research works at the linear algebra level can

Method for the Discrete Problem Formulation of the Domain Decomposition

specifically, we consider that the model problem is given by where for simplicity we will consider the case of two subdomains. ourselves to studying the solution of the one-dimensional Helmholtz equation To illustrate the difficulties the method presents in this case we restrict

$$-u'' + cu = f \quad \text{in} \quad \Omega \equiv (0, 1)$$

$$u(0) = \alpha \quad \text{and} \quad u(1) = \beta$$

$$(4)$$

where c is a positive constant and α , β are the given boundary values.

size h is imposed on $\overline{\Omega}$, where $h = \frac{1}{n+1}$, $n \geq 5$ odd, and a three-point finite difference discretization formula is used to approximate the values of the x_i that corresponds to the interface. unknown function at the grid points. Let $p = \frac{n+1}{2}$ be the index of the point We then split the domain Ω into the two subdomains $\Omega_1 \equiv (0, \frac{1}{2})$ and $\Omega_2 \equiv (\frac{1}{2}, 1)$ so that the interface Γ is at $x = \frac{1}{2}$. A uniform grid of mesh as p while if we are working in subdomain Ω_2 p' will be used instead. the sequel, in case we are working in subdomain Ω_1 the index p will be used For reasons that will become clear in

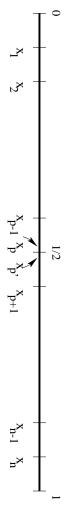

Figure 1: Discretization of Domain Ω

Derivation of the Equations of the Linear System

3.1.1 First Approach

Using Taylor series expansion about any interior grid point x_i we can obtain

$$u''(x_i) = \frac{u(x_{i-1}) - 2u(x_i) + u(x_{i+1})}{h^2} + O(h^2).$$

will be yielded sweep of the iterative method on the subdomain Ω_1 the following equations domain decomposition method described previously in (2), after the first ing the one on the interface, and following closely the iterative scheme of the Then considering the given differential equation (4) at all grid points, exclud-Let u_i denote the approximation of $u(x_i)$ resulting from the numerical scheme.

$$(2+ch^{2})u_{1}^{(1)} - u_{2}^{(1)} = h^{2}f(x_{1}) + \alpha$$

$$-u_{1}^{(1)} + (2+ch^{2})u_{2}^{(1)} - u_{3}^{(1)} = h^{2}f(x_{2})$$

$$\vdots$$

$$-u_{p-3}^{(1)} + (2+ch^{2})u_{p-2}^{(1)} - u_{p-1}^{(1)} = h^{2}f(x_{p-2})$$

$$-u_{p-2}^{(1)} + (2+ch^{2})u_{p-1}^{(1)} - u_{p}^{(1)} = h^{2}f(x_{p-1})$$

$$u_{p}^{(1)} = bu_{p}^{(0)} + (1-b)u_{p'}^{(0)}$$

$$(5)$$

tions will be quirement on the interface. For the subdomain Ω_2 , the corresponding equa-Obviously, the last equation satisfies the domain decomposition method re-

$$u_{p'}^{(1)} = (1 - b)u_{p}^{(0)} + bu_{p'}^{(0)}$$

$$-u_{p'}^{(1)} + (2 + ch^{2})u_{p+1}^{(1)} - u_{p+2}^{(1)} = h^{2}f(x_{p+1})$$

$$-u_{p+1}^{(1)} + (2 + ch^{2})u_{p+2}^{(1)} - u_{p+3}^{(1)} = h^{2}f(x_{p+2})$$

$$\vdots$$

$$-u_{n-2}^{(1)} + (2 + ch^{2})u_{n-1}^{(1)} - u_{n}^{(1)} = h^{2}f(x_{n-1})$$

$$-u_{n-1}^{(1)} + (2 + ch^{2})u_{n}^{(1)} = h^{2}f(x_{n}) + \beta$$

$$(6)$$

If we now proceed to the next iteration, the domain decomposition method requirement on the interface for Ω_1 will be $u'^{(2)}_p = au'^{(1)}_p + (1-a)u'^{(1)}_{p'}$ while for Ω_2 will be $u'^{(2)}_{p'} = (1-a)u'^{(1)}_p + au'^{(1)}_{p'}$. To find a way to determine the derivative at the points x_p and $x_{p'}$, using in each case points only from Ω_1

ProblemFormulation of the Domain Decomposition Method for the Discrete Derivation of the Equations of the Linear System

and Ω_2 , respectively, we work as follows ([5]). For u'_p we write down

$$u(x) = u(x)$$

$$u(x-h) = u(x) - hu'(x) + \frac{h^2}{2}u''(x) + O(h^3)$$

$$u(x-2h) = u(x) - 2hu'(x) + 2h^2u''(x) + O(h^3)$$

from which one can very easily get that

$$-3u(x) + 4u(x-h) - u(x-2h) = -2hu'(x) + O(h^3)$$

or, equivalently,

$$u'(x) = \frac{3u(x) - 4u(x - h) + u(x - 2h)}{2h} + O(h^2)$$

Similarly, for Ω_2 we will have

$$u'(x) = \frac{-3u(x) + 4u(x+h) - u(x+2h)}{2h} + O(h^2)$$

To satisfy the aforementioned requirements on the interface, we will have

$$\begin{aligned} w_p^{\prime(2)} &= aw_p^{\prime(1)} + (1-a)w_{p'}^{\prime(1)} \iff \\ 3u_p^{(2)} - 4u_{p-1}^{(2)} + u_{p-2}^{(2)} &= \\ a(3u_p^{(1)} - 4u_{p-1}^{(1)} + u_{p-2}^{(1)}) + (1-a)(-3u_p^{(1)} + 4u_{p+1}^{(1)} - u_{p+2}^{(1)}) \iff \\ 3u_p^{(2)} - 4u_{p-1}^{(2)} + u_{p-2}^{(2)} &= \\ a(3(bu_p^{(0)} + (1-b)u_p^{(0)}) - 4u_{p-1}^{(1)} + u_{p-2}^{(1)}) + \\ (1-a)(-3((1-b)u_p^{(0)} + bu_p^{(0)}) + 4u_{p+1}^{(1)} - u_{p+2}^{(1)}) \iff \\ -au_{p-2}^{(1)} + 4au_{p-1}^{(1)} - 4(1-a)u_{p+1}^{(1)} + (1-a)u_{p+2}^{(1)} + u_{p-2}^{(2)} - 4u_{p-1}^{(2)} + 3u_p^{(2)} = \\ 3(a+b-1)u_p^{(0)} + 3(a-b)u_{p'}^{(0)} \end{aligned}$$

So the equations for Ω_1 for the second iteration will be

$$(2+ch^{2})u_{1}^{(2)} - u_{2}^{(2)} = h^{2}f(x_{1}) + \alpha$$

$$-u_{1}^{(2)} + (2+ch^{2})u_{2}^{(2)} - u_{3}^{(2)} = h^{2}f(x_{2})$$

$$\vdots$$

$$-u_{p-3}^{(2)} + (2+ch^{2})u_{p-2}^{(2)} - u_{p-1}^{(2)} = h^{2}f(x_{p-2})$$

$$-u_{p-2}^{(2)} + (2+ch^{2})u_{p-1}^{(2)} - u_{p}^{(2)} = h^{2}f(x_{p-1})$$

$$-au_{p-2}^{(1)} + 4au_{p-1}^{(1)} - 4(1-a)u_{p+1}^{(1)} + (1-a)u_{p+2}^{(1)} + u_{p-2}^{(2)} - 4u_{p-1}^{(2)} + 3u_{p}^{(2)} =$$

$$3(a+b-1)u_{p}^{(0)} + 3(a-b)u_{p'}^{(0)}$$

$$(7)$$

Again to satisfy the requirements on Γ for Ω_2 we will have

$$u_{p'}^{\prime(2)} = (1-a)u_{p}^{\prime(1)} + au_{p'}^{\prime(1)} \iff (1-a)u_{p-2}^{(1)} - 4(1-a)u_{p-1}^{(1)} + 4au_{p+1}^{(1)} - au_{p+2}^{(1)} + 3u_{p'}^{(2)} - 4u_{p+1}^{(2)} + u_{p+2}^{(2)} = 3(a-b)u_{p}^{(0)} + 3(a+b-1)u_{p'}^{(0)}$$

So the equations for Ω_2 for the second iteration will be

$$(1-a)u_{p-2}^{(1)} - 4(1-a)u_{p-1}^{(1)} + 4au_{p+1}^{(1)} - au_{p+2}^{(1)} + 3u_{p'}^{(2)} - 4u_{p+1}^{(2)} + u_{p+2}^{(2)} = 3(a-b)u_{p}^{(0)} + 3(a+b-1)u_{p'}^{(0)}$$

$$-u_{p'}^{(2)} + (2+ch^2)u_{p+1}^{(2)} - u_{p+2}^{(2)} = h^2 f(x_{p+1})$$

$$-u_{p+1}^{(2)} + (2+ch^2)u_{p+2}^{(2)} - u_{p+3}^{(2)} = h^2 f(x_{p+2})$$

$$\vdots$$

$$-u_{n-2}^{(2)} + (2+ch^2)u_{n-1}^{(2)} - u_n^{(2)} = h^2 f(x_{n-1})$$

$$-u_{n-1}^{(2)} + (2+ch^2)u_{n-1}^{(2)} - u_n^{(2)} = h^2 f(x_n) + \beta$$

$$(8)$$

3.1.2 Second Approach

tion of the second and fourth block, will not only satisfy the requirements this case the last equation of the first and third block and the first equabecause we use the differential equation on the interface node as well. So in As we have already mentioned, the second approach differs from the first one,

Formulation of the Domain Decomposition Method for the Discrete Derivation of the Equations of the Linear System

of our domain decomposition method, but they will also be the equations at the interface point(s) and thus will implicitly satisfy the requirements of our

So for the first iteration, in Ω_1 , we will have

$$-u_{p-2}^{(1)} + (2+ch^2)u_{p-1}^{(1)} - u_p^{(1)} = h^2 f(x_{p-1})$$

We substitute $u_p^{(1)}$ with $bu_p^{(0)} + (1-b)u_{p'}^{(0)}$ to get

$$-u_{p-2}^{(1)} + (2+ch^2)u_{p-1}^{(1)} = h^2 f(x_{p-1}) + bu_p^{(0)} + (1-b)u_{p'}^{(0)}$$

Similarly, in Ω_2 we will have

$$-u_{p'}^{(1)} + (2+ch^2)u_{p+1}^{(1)} - u_{p+2}^{(1)} = h^2 f(x_{p+1})$$

We now substitute $u_{p'}^{(1)}$ with $(1-b)u_p^{(0)} + bu_{p'}^{(0)}$.

Thus our new equation will be

$$(2+ch^2)u_{p+1}^{(1)}-u_{p+2}^{(1)}=h^2f(x_{p+1})+(1-b)u_p^{(0)}+bu_{p'}^{(0)}$$

the discretization scheme on the interface we would have For the second iteration things are slightly different. If we tried to apply

$$-u_{p-1}^{(2)} + (2+ch^2)u_p^{(2)} - u_{p+1}^{(2)} = h^2 f(x_p)$$

replace u_{p+1} with values at points in the left subdomain. For this we know But now u_{p+1} is only a fictitious point for Ω_1 . So we need to find a way to

$$u'(x) = \frac{u(x+h) - u(x-h)}{2h} + O(h^2).$$

So, applying this relation at the point x_p we equivalently have that

$$u(x_{p+1}) = 2hu'(x_p) + u(x_{p-1}) + O(h^2)$$

and the equation is now transformed into

$$-u_{p-1}^{(2)} + (2 + ch^2)u_p^{(2)} - 2hu_p^{(2)} - u_{p-1}^{(2)} = h^2 f(x_p)$$

We now substitute $u_p'^{(2)}$ with $au_p'^{(1)} + (1-a)u_{p'}^{(1)}$. Thus our new equation will

$$-2hau_p'^{(1)} - 2h(1-a)u_{p'}^{(1)} - 2u_{p-1}^{(2)} + (2+ch^2)u_p^{(2)} = h^2f(x_p)$$

the equation above to obtain an equivalent one. Namely, points only from Ω_1 and Ω_2 respectively, we substitute these expressions in However, since we have already found expressions for u'_p and $u'_{p'}$, using

$$-au_{p-2}^{(1)} + 4au_{p-1}^{(1)} - 4(1-a)u_{p+1}^{(1)} + (1-a)u_{p+2}^{(1)} - 2u_{p-1}^{(2)} + (2+ch^2)u_p^{(2)} = h^2f(x_p) + 3au_p^{(0)} - 3(1-a)u_{p'}^{(0)}$$

Similarly, for Ω_2 , the equation that we will obtain eventually is

$$(1-a)u_{p-2}^{(1)}-4(1-a)u_{p-1}^{(1)}+4au_{p+1}^{(1)}-au_{p+2}^{(1)}+(2+ch^2)u_{p'}^{(2)}-2u_{p+1}^{(2)}=h^2f(x_p)-3(1-a)u_p^{(0)}+3au_{p'}^{(0)}$$

The rest remains the same as in the previous approach.

Formulation of the Iterative Scheme in Matrix Form

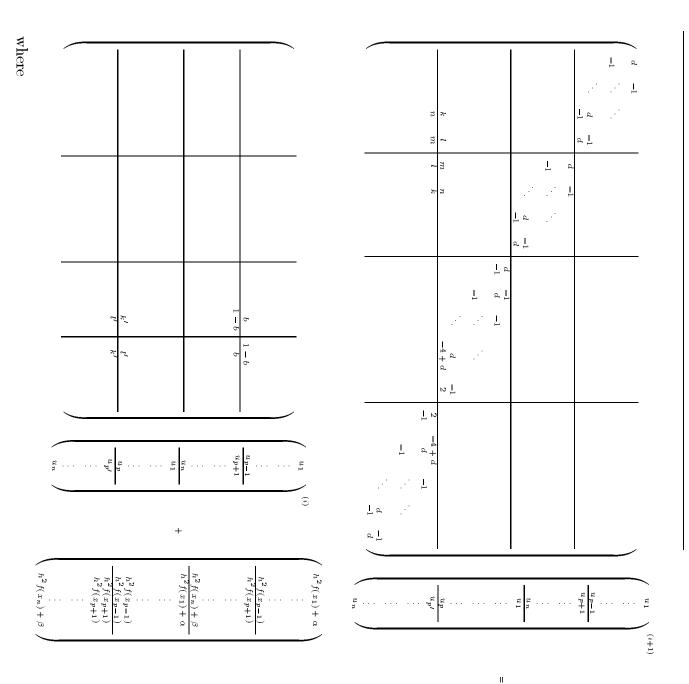

sake of simplicity in the calculations that will follow we will make the sub-Dirichlet-type half-iteration and a Neumann-type half-iteration. these two iterations in one. In this way, a new iteration will consist of a for the domain decomposition method we proposed. We will now consider In the previous section we saw how we could obtain two successive iterations

$$2 + ch^2 = 2\cosh\phi.$$

3.2.1 Formulation of the First Approach

scheme The sets of equations (5), (6), (7) and (8) lead to the equivalent iterative

ProblemFormulation of the Domain Decomposition Method for the Discrete $Formulation \ \ of the \ Iterative \ Scheme \ in \ Matrix \ Form$

k' = 3(a+b-1)

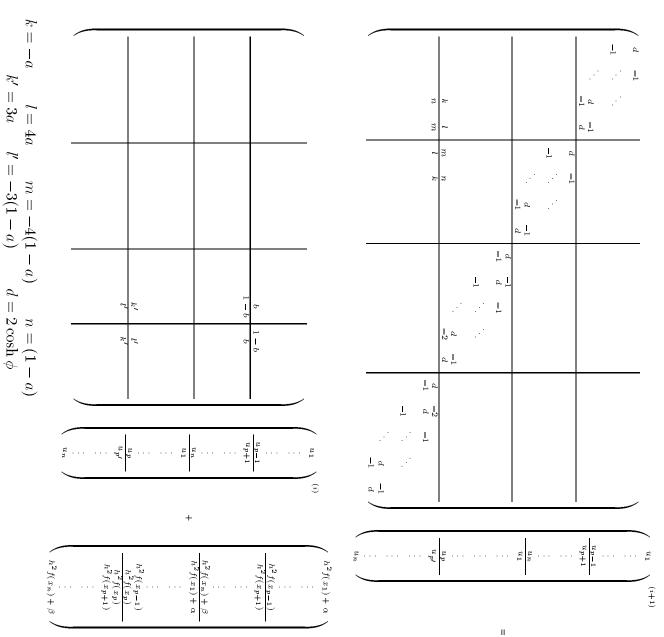

l = 4a

m = -4(1-a)l' = -3(b-a)

n = (1 - a) $d = 2\cosh \phi$

3.2.2Formulation of the Second Approach

In a similar way we can obtain for the second approach

k' = 3a

l' = -3(1-a)

3.2.3 Iterative Solution of the Linear System

of vectors $u^{(i)}$ points and the point on the interface. respectively, of the iterative schemes in sections (3.2.1) and (3.2.2), the system has the form Au = b or, equivalently, (M - N)u = b. The matrices a linear system. This system is formed from the equations that approximate provided they converge. tor u is the vector that contains the approximate values of u(x) at the grid vector b is the known vector of the right hand sides, while the unknown vec-M and N are the two matrices shown on the left and the right hand sides, the interface in both the Dirichlet and the Neumann iterations. Each linear domains and also from the equations obtained from conditions imposed on the given differential equation at all the interior grid points of the two sub-Each one of the two iterative schemes in the two different approaches solves produced by each one of the two iterative schemes proposed This vector is the limit of the sequence

as we have already mentioned, p is the index of the point that corresponds to the interface point $p = \frac{n+1}{2}$. Thus the dimensions of the two matrices M and N in each iteration scheme are $2n \times 2n$ $(p-1)\times(p-1)$, while those of the last two tri-diagonal blocks are $p\times p$, where The dimensions of the first two tri-diagonal blocks of the matrix M are

18

4 Convergence Analysis

[1], [17], and [18]). The iterative schemes that we have formed in the previous section can be described by the following procedure $Mu^{(i+1)} = Nu^{(i)} + b$. In in the forms below eters a, b so that our iterative schemes converge as fast as possible (see, e.g., both approaches the matrices M and N involved can be written in general In this section our aim is to determine the optimum values for the param-

 $\quad \text{and} \quad$

N =

non-zero ones. possible positions in the corresponding blocks where the elements may be It is noted that the symbol "-" in the previous matrices indicates the **only**

The Iteration Matrix T of the Procedure

able task. For this reason, we shall take advantage of the properties that Mavoid computing M^{-1} explicitly since this is a very demanding and unaffordappears to have. For this we can easily realize and prove that Exploiting the block form as well as the sparsity of the matrix M we may Let T = M'N, where $M' = M^{-1}$, be the iteration matrix of the procedure.

- 1. M^{-1} will not have the 'Zero Blocks' filled in with non-zero elements,
- The blocks $M_{11}^{-1}, M_{22}^{-1}, M_{33}^{-1}$ and M_{44}^{-1} will be filled with non–zero elements and will not preserve the tridiagonal form any more.

These remarks make of course our approach much easier because we now need to compute only the blocks that appear in the figure below

	$M^{'}$						
		Ш					
$M_{41}^{'}$	$M_{31}^{'}$		M_{11}^{\prime}				
M_{42}'	$M_{32}^{'}$	M_{22}^{\prime}					
	$M_{33}^{'}$						
$M_{44}^{'}$							

where

$$M \times M' = I$$

The blocks of the matrix M^{-1} , we need to compute satisfy the equations

$$M_{11}M'_{11} = I$$

$$M_{22}M'_{22} = I$$

$$M_{33}M'_{33} = I$$

$$M_{44}M'_{44} = I$$

$$M_{31}M'_{11} + M_{33}M'_{31} = 0$$

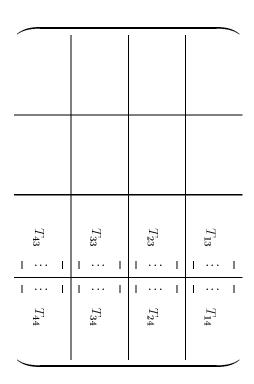

$$M_{32}M'_{22} + M_{33}M'_{32} = 0$$

$$M_{41}M'_{11} + M_{44}M'_{41} = 0$$

$$M_{42}M'_{22} + M_{44}M'_{42} = 0$$

$$(9)$$

will have the following sparsity pattern Because of the sparsity of N it can be readily checked that $T=M^{-1}N$

tion of the spectrum of it much easier. The sparsity pattern of T indicated above makes the task of the determina-

Determination of the Eigenvalues of

find the eigenvalues of T. For this we form the expression below Since our objective is to solve the optimization problem $\min_{a,b} \rho(T)$ we must

	I	1		IV - II
			$-\lambda I$	
		$-\lambda I$		
T_{41}	$T_{33} - \lambda I$	T_{23}	T_{13}	
$T_{42} - \lambda I$	T_{34}	T_{24}	T_{14}	

Our problem is now to find all $\lambda \in \mathbb{C}$ such that $det(T - \lambda I) = 0$.

2(p-1) columns we will obtain we can readily see that because of the presence of zero elements in the first If we expand the determinant about the elements of its first column etc.,

$$det(T - \lambda I)$$

$$= (-\lambda)^{n-1} det$$

$$\begin{bmatrix}
T_{33} - \lambda I & \vdots & \vdots & T_{34} \\
 & - & - & - & - \\
 & T_{43} & \vdots & \vdots & T_{44} - \lambda I
\end{bmatrix}$$

and so we need to compute the determinant of the last two blocks only. the first and the last p-1 columns, we will eventually obtain Using the same idea again and expanding successively about the elements of

$$= (-\lambda)^{2n-2} \det \begin{pmatrix} -\lambda + t_{3p-2,3p-2} & t_{3p-2,3p-1} \\ t_{3p-1,3p-2} & -\lambda + t_{3p-1,3p-1} \end{pmatrix}$$

iteration matrix T, only four of its elements are needed! So, we observe that in order to determine explicitly all the eigenvalues of the

$$\det(T - \lambda I) = 0 \iff (-\lambda)^{2n-2} ((-\lambda + t_{3p-2,3p-2})(-\lambda + t_{3p-1,3p-1}) - t_{3p-2,3p-1}t_{3p-1,3p-2}) = 0$$

of $\rho(T)$ we are just wondering if we can find values for the two parameters just made and bearing in mind that our problem is that of the minimization other eigenvalues that are given as the zeros of a quadratic equation whose we can see that T has the eigenvalue $\lambda=0$ with a multiplicity 2n-2 and two following two equations must be satisfied that make the zeros of the aforementioned quadratic be zero. For this the coefficients are functions of the two parameters a, b. From the observation

$$t_{3p-2,3p-2} + t_{3p-1,3p-1} = 0$$
 (10)

$$t_{3p-2,3p-2} + t_{3p-1,3p-1} = 0 (10)$$

$$t_{3p-2,3p-2} + t_{3p-1,3p-1} = 0 (11)$$

Determination of the Elements of the Matrix T

tive matrix T = M'N that appear in equations (10) and (11). At this point we should see how we can determine the elements of the itera-

$$t_{i,3p-2} = \sum_{k=1}^{n} m'_{i,k} n_{k,3p-2}$$

$$= m'_{i,p-1} n_{p-1,3p-2} + m'_{i,p} n_{p,3p-2} + m'_{i,3p-2} n_{3p-2,3p-2} + m'_{i,3p-1} n_{3p-1,3p-2}$$

$$= m'_{i,p-1} n_{p-1,3p-2} + m'_{i,p} n_{p,3p-2} + m'_{i,3p-2} n_{3p-2,3p-2} + m'_{i,3p-1} n_{3p-1,3p-2}$$
(12)

$$t_{i,3p-1} = \sum_{k=1}^{n} m'_{i,k} n_{k,3p-1}$$

$$= m'_{i,p-1} n_{p-1,3p-1} + m'_{i,p} n_{p,3p-1} + m'_{i,3p-2} n_{3p-2,3p-1} + m'_{i,3p-1} n_{3p-1,3p-1}$$

$$= m'_{i,p-1} n_{p-1,3p-1} + m'_{i,p} n_{p,3p-1} + m'_{i,3p-2} n_{3p-2,3p-1} + m'_{i,3p-1} n_{3p-1,3p-1}$$

$$= m'_{i,p-1} n_{p-1,3p-1} + m'_{i,p} n_{p,3p-1} + m'_{i,3p-2} n_{3p-2,3p-1} + m'_{i,3p-1} n_{3p-1,3p-1} + m'_{i,3p-1} n_{3p-1,3p-1} + m'_{i,3p-2} n_{3p-2,3p-1} + m'_{i,3p-2} n_{3p-2,3p-2} + m'_{i,3p-2} n_{3p-2,3p-2} + m'_{i,3p-2} n_{3p-2,3p-2} + m'_{i,3p-2} n_{3p-2,3p-2} + m'_{i,3p-2} n_{3p-2} + m'_{i,3p-2} + m'_{i,3p-2} n_{3p-2} + m'_{i,3p-2} +$$

If we apply equations (12) and (13) for determining the four elements of T that we need in equations (10) and (11) we will have

$$f_{3p-2,3p-2} = m'_{3p-2,p-1}n_{p-1,3p-2} + m'_{3p-2,p}n_{p,3p-2} + m'_{3p-2,3p-2}n_{3p-2,3p-2}$$
 (14)

$$t_{3p-2,3p-1} = m'_{3p-2,p-1}n_{p-1,3p-1} + m'_{3p-2,p}n_{p,3p-1} + m'_{3p-2,3p-2}n_{3p-2,3p-1}$$
(15)

$$t_{3p-1,3p-2} = m'_{3p-1,p-1}n_{p-1,3p-2} + m'_{3p-1,p}n_{p,3p-2} + m'_{3p-1,3p-1}n_{3p-1,3p-2}$$
(16)

$$t_{3p-1,3p-1} = m'_{3p-1,p-1}n_{p-1,3p-1} + m'_{3p-1,p}n_{p,3p-1} + m'_{3p-1,3p-1}n_{3p-1,3p-1}$$
(17)

involved. So, what we need is to determine these six elements only. In the aforementioned equations, there are **only six** elements of M' (= M^{-1})

order to find them, difference equations will be used ([5]). unnecessary computations. In the sequel, we will take full advantage of the of all the matrices and submatrices involved in order to avoid heavy and elements that we need for our computations in the most convenient way. In properties of all the matrices, to obtain analytic expressions for the very few So far, we have taken, in some way, advantage of the form and sparsity

From equations (9) we obtain equivalently the equations we need to com-

$$M'_{11} = M_{11}^{-1}$$

$$M'_{22} = M_{22}^{-1}$$

$$M'_{33} = M_{33}^{-1}$$

$$M'_{44} = M_{44}^{-1}$$

$$M'_{31} = M'_{33}M_{31}M'_{11}$$

$$M'_{32} = M'_{33}M_{32}M'_{22}$$

$$M'_{41} = M'_{44}M_{41}M'_{11}$$

$$M'_{42} = M'_{44}M_{42}M'_{22}$$

If we use the equations above we have that

$$m'_{3p-2,p-1} = -m'_{3p-2,3p-2}(m_{3p-2,p-2}m'_{p-2,p-1} + m_{3p-2,p-1}m'_{p-1,p-1}) (18)$$

$$m'_{3p-2,p} = -m'_{3p-2,3p-2}(m_{3p-2,p}m'_{p,p} + m_{3p-2,p+1}m'_{p+1,p})$$
(19)

$$m'_{3p-2,p} = -m'_{3p-2,3p-2}(m_{3p-2,p}m'_{p,p} + m_{3p-2,p+1}m'_{p+1,p})$$
 (19)

$$m'_{3p-1,p-1} = -m'_{3p-1,3p-1}(m_{3p-1,p-2}m'_{p-2,p-1} + m_{3p-1,p-1}m'_{p-1,p-1}) (20)$$

$$m'_{3p-1,p-1} = -m'_{3p-1,3p-1}(m_{3p-1,p-2}m'_{p-2,p-1} + m_{3p-1,p-1}m'_{p-1,p-1}) (21)$$

Determination of a and b: First Approach

(17). So we equivalently have We substitute the elements of the matrix N in equations (14), (15), (16) and

$$t_{3p-2,3p-2} = bm'_{3p-2,p-1} + (1-b)m'_{3p-2,p} + 3(a+b-1)m'_{3p-2,3p-2}$$
 (22)

$$t_{3p-2,3p-1} = (1-b)m'_{3p-2,p-1} + bm'_{3p-2,p} - 3(b-a)m'_{3p-2,3p-2}$$
 (23)

$$t_{3p-1,3p-2} = bm'_{3p-1,p-1} + (1-b)m'_{3p-1,p} - 3(b-a)m'_{3p-1,3p-1}$$
 (24)

$$t_{3p-1,3p-1} = (1-b)m'_{3p-1,p-1} + bm'_{3p-1,p} + 3(a+b-1)m'_{3p-1,3p-1}$$
(25)

Determination of $m'_{p-2,p-1} m'_{p-1,p-1} m'_{p,p}$ and $m'_{p+1,p}$

ing down the equations that arise from the last column we will have $1, 2, \ldots, p-1$. Thus, doing the multiplication indicated previously, and writ-Let then the elements of the last column of M'_{11} be denoted by x_i , they are the last two elements of the last column. We know that $M_{11}M'_{11}=I$. Elements $m'_{p-2,p-1}$ and $m'_{p-1,p-1}$ belong to the block M'_{11} and specifically

$$2\cosh\phi x_{1} - x_{2} = 0$$

$$-x_{1} + 2\cosh\phi x_{2} - x_{3} = 0$$

$$\vdots$$

$$-x_{p-3} + 2\cosh\phi x_{p-2} - x_{p-1} = 0$$

$$-x_{p-2} + 2\cosh\phi x_{p-1} = 1$$

Or, equivalently,

$$x_0 = 0 \tag{26}$$

$$-x_{i-1} + 2\cosh\phi x_i - x_{i+1} = 0 \quad i = 1, \dots, p-1$$
 (27)

$$x_p = 1 (28)$$

equation then this difference equation will hold for i = 0 and and i = p as in such a way so that x_0 and x_p are given by the solution of the difference requiring that x_0 and x_p satisfy them. If in addition x_{-1} and x_{p+1} are defined obtained by applying the general equation for i = 1 and i = p - 1 and well. To solve (27) we consider its characteristic equation (28) can be regarded as its boundary conditions. Equation (27) is the general difference equation, whereas equations (26) and Boundary conditions are

$$\rho^2 - (2\cosh\phi)\rho + 1 = 0$$

whose solutions are

$$\rho_1 = \cosh \phi + \sinh \phi \text{ and } \rho_2 = \cosh \phi - \sinh \phi$$

Thus the general solution of (27) is

$$x_i = c_1(\cosh\phi + \sinh\phi)^i + c_2(\cosh\phi - \sinh\phi)^i$$

= $c_1e^{i\phi} + c_2e^{-i\phi}$

Applying the boundary condition (27) we have

$$x_0 = 0 \iff c_1 + c_2 = 0 \iff c_2 = -c_1$$

which makes the general solution of (27)

$$x_i = c_1 e^{i\phi} - c_1 e^{-i\phi} = 2c_1 \sinh i\phi$$
 (29)

If we now apply (28) we have

$$x_p = 1 \iff 2c_1 \sinh p\phi = 1 \iff c_1 = \frac{1}{2 \sinh p\phi}$$

from the expression However, from (29) we can obtain all the elements of the last column of M'_{11}

$$x_i = \frac{\sinh i\phi}{\sinh p\phi}$$

Therefore

$$m'_{p-2,p-1} \; = \; \frac{\sinh(p-2)\phi}{\sinh p\phi} \qquad \qquad m'_{p-1,p-1} \; = \; \frac{\sinh(p-1)\phi}{\sinh p\phi}$$

centro–symmetric. Therefore, the first two elements of the first column of M'_{22} are the same as the last two elements of the last column of M'_{11} in reverse symmetric. So will then be their inverses. Thus M'_{11} and M'_{22} are also its first column. We also note that the matrices M_{11} and M_{22} are centro-To go on with our analysis we observe that the elements $m'_{p,p}$ and $m'_{p+1,p}$ belong to the block M'_{22} and specifically they are the first two elements of

Consequently,

$$m'_{p,p} = \frac{\sinh(p-1)\phi}{\sinh p\phi} \qquad m'_{p+1,p} = \frac{\sinh(p-2)\phi}{\sinh p\phi}$$

4.4.2 Determination of $m'_{3p-2,3p-2} m'_{3p-1,3p-1}$

ically it is the last element of its last column. We observe that the element $m'_{3p-2,3p-2}$ belongs to the block M'_{33} and specif-

column of M'_{33} by x_i , $i=1,2,\ldots,p$, we can write down the equations that arise in the last column which are the following Again, starting with $M_{33}M'_{33}=I$ and denoting the elements of the last

$$2\cosh\phi x_{1} - x_{2} = 0$$

$$-x_{1} + 2\cosh\phi x_{2} - x_{3} = 0$$

$$\vdots$$

$$-x_{p-2} + 2\cosh\phi x_{p-1} - x_{p} = 0$$

$$(-4 + 2\cosh\phi) x_{p-1} + 2x_{p} = 1$$

Or, equivalently,

$$x_0 = 0 (30)$$

$$-x_{i-1} + 2\cosh\phi x_i - x_{i+1} = 0 \quad i = 1, \dots, p \quad (31)$$

$$(2\cosh^2\phi - 4\cosh\phi + 1)x_{p-1} + x_{p+1} = \cosh\phi$$
 (32)

equation is (30) and (32) are the boundary conditions. Working in a similar way as in the previous case we have to solve the difference equation (31). Its characteristic Again, equation (31) is the general difference equation, whereas equations

$$o^2 - (2\cosh\phi)\rho + 1 = 0$$

given by and as we have already seen in section 4.4.1 the general solution of (31) is

$$x_i = c_1 e^{i\phi} + c_2 e^{-i\phi}$$

Applying the boundary condition (30) we have

$$x_0 = 0 \iff c_1 + c_2 = 0 \iff c_2 = -c_1$$

which makes the general solution of (31)

$$x_i = c_1 e^{i\phi} - c_1 e^{-i\phi} = 2c_1 \sinh i\phi$$
 (33)

If we now apply (32) we have

$$(2\cosh^{2}\phi - 4\cosh\phi + 1)x_{p-1} + x_{p+1} = \cosh\phi \iff (2\cosh^{2}\phi - 4\cosh\phi + 1)2c_{1}\sinh(p-1)\phi + 2c_{1}\sinh(p+1)\phi = \cosh\phi \iff c_{1} = \frac{\cosh\phi}{2\sinh(p+1)\phi + 2\sinh(p-1)\phi}(2\cosh^{2}\phi - 4\cosh\phi + 1)$$

the expression From (33) we can now obtain all the elements of the last column of M'_{33} from

$$x_i = \frac{\cosh \phi \sinh i\phi}{\sinh(p+1)\phi + \sinh(p-1)\phi \left(2\cosh^2 \phi - 4\cosh \phi + 1\right)}$$

Therefore

$$m'_{3p-2,3p-2} = \frac{\sinh p\phi \cosh \phi}{\sinh (p+1)\phi + \sinh (p-1)\phi \left(2\cosh^2\phi - 4\cosh\phi + 1\right)}$$

first element of its first column. We note that this time the matrices M_{33} and Therefore. column of M'44 is the same as the last element of the last column of M'_{33} . possessed by their inverses M'_{33} and M'_{44} . M_{44} are centro-symmetric to each other meaning that the same property is Now element $m'_{3p-1,3p-1}$ belongs to the block M'_{44} and specifically it is the So the first element of the first

$$m'_{3p-1,3p-1} = \frac{\sinh p\phi \cosh \phi}{\sinh(p+1)\phi + \sinh(p-1)\phi (2\cosh^2\phi - 4\cosh\phi + 1)}$$

Determination of $m'_{3p-2,p-1}$, $m'_{3p-2,p}$, $m'_{3p-1,p-1}$ and $m'_{3p-1,p}$

If we use equations (18) and (19) we readily have

(18)
$$\iff m'_{3p-2,p-1} = \frac{a \cosh \phi \left(\sinh(p-2)\phi - 4\sinh(p-1)\phi\right)}{\sinh(p+1)\phi + \sinh(p-1)\phi \left(2\cosh^2\phi - 4\cosh\phi + 1\right)}$$

(19)
$$\iff m'_{3p-2,p} = \frac{(1-a)\cosh\phi(4\sinh(p-1)\phi - \sinh(p-2)\phi)}{\sinh(p+1)\phi + \sinh(p-1)\phi(2\cosh^2\phi - 4\cosh\phi + 1)}$$

If we now use the equations (20) and (21) we have

(20)
$$\iff m'_{3p-1,p-1} = \frac{(1-a)\cosh\phi(4\sinh(p-1)\phi - \sinh(p-2)\phi)}{\sinh(p+1)\phi + \sinh(p-1)\phi(2\cosh^2\phi - 4\cosh\phi + 1)}$$

(21)
$$\iff m'_{3p-1,p} = \frac{a \cosh \phi \left(\sinh(p-2)\phi - 4\sinh(p-1)\phi\right)}{\sinh(p+1)\phi + \sinh(p-1)\phi \left(2\cosh^2\phi - 4\cosh\phi + 1\right)}$$

4.4.4 Elements of the Matrix T: First Approach

If we use equations (22)–(25) we have

(22)
$$\iff t_{3p-2,3p-2} = \frac{(a+b-1)\cosh\phi(\sinh(p-2)\phi - 4\sinh(p-1)\phi) + 3(a+b-1)\cosh\phi\sinh\phi}{\sinh(p+1)\phi + \sinh(p-1)\phi(2\cosh^2\phi - 4\cosh\phi + 1)}$$

(23)
$$\iff t_{3p-2,3p-1} = \frac{(a-b)\cosh\phi(\sinh(p-2)\phi - 4\sinh(p-1)\phi) - 3(b-a)\cosh\phi\sinh p\phi}{\sinh(p+1)\phi + \sinh(p-1)\phi(2\cosh^2\phi - 4\cosh\phi + 1)}$$

(24)
$$\iff t_{3p-1,3p-2} = \frac{(a-b)\cosh\phi(\sinh(p-2)\phi - 4\sinh(p-1)\phi) - 3(b-a)\cosh\phi\sinh p\phi}{\sinh(p+1)\phi + \sinh(p-1)\phi(2\cosh^2\phi - 4\cosh\phi + 1)}$$

(25)
$$\iff t_{3p-1,3p-1} = \frac{(a+b-1)\cosh\phi(\sinh(p-2)\phi - 4\sinh(p-1)\phi) + 3(a+b-1)\cosh\phi\sinh p\phi}{\sinh(p+1)\phi + \sinh(p-1)\phi(2\cosh^2\phi - 4\cosh\phi + 1)}$$

4.4.5 Optimum Values of a and b

(11). These equations give successively Now we have all the elements that will allow us to use equations (10) and

(10)
$$\iff$$
 $(a+b-1)(\sinh(p-2)\phi - 4\sinh(p-1)\phi + 3\sinh p\phi) = 0$
 \iff $a+b-1 = 0$ (34)

1)
$$\iff$$
 $[(a+b-1)((\sinh(p-2)\phi - 4\sinh(p-1)\phi + 3\sinh p\phi)]^2 - [(a-b)(\sinh(p-2)\phi - 4\sinh(p-1)\phi + 3\sinh p\phi)]^2 = 0$
 \iff $(a+b-1)^2 - (a-b)^2 = 0$
 \iff $(2a-1)(2b-1) = 0$
 \iff $a = \frac{1}{2}$ or $b = \frac{1}{2}$ (35)

in the product preceding it is different form zero. Now, in view of (34) either solution of equation (35) gives as the optimum values for a and b the following Equation (34) was obtained since it can be proved that the second factor

$$a = \frac{1}{2}$$
 and $b = \frac{1}{2}$

REMARK

obtained after two iterations. the absence of round-off errors the exact solution of the linear system will four elements $t_{3p-2,3p-2}$, $t_{3p-2,3p-1}$, $t_{3p-1,3p-2}$, $t_{3p-1,3p-1}$ of T become zero. As a result of this, it can be checked out that $T^2 = 0$ (!) implying that in For the optimum values of a and b just determined we observe that the 0 (!) implying that in

Determination of a and b: Second Approach

obtain equivalently the elements of the matrix N in the equations (14), (15), (16) and (17) and A similar analysis to the one before can be done. Specifically, we substitute

$$t_{3p-2,3p-2} = bm'_{3p-2,p-1} + (1-b)m'_{3p-2,p} + 3am'_{3p-2,3p-2}$$
 (36)

$$t_{3p-2,3p-1} = (1-b)m'_{3p-2,p-1} + bm'_{3p-2,p} - 3(1-a)m'_{3p-2,3p-2}$$
 (37)

$$t_{3p-1,3p-2} = bm'_{3p-1,p-1} + (1-b)m'_{3p-1,p} - 3(1-a)m'_{3p-1,3p-1}$$
 (38)

$$t_{3p-1,3p-1} = (1-b)m'_{3p-1,p-1} + bm'_{3p-1,p} + 3am'_{3p-1,3p-1}$$
 (3)

Determination of $m'_{p-2,p-1}$ $m'_{p-1,p-1}$ $m'_{p,p}$ and $m'_{p+1,p}$

Here we follow exactly the same steps as in section 4.4.1. Consequently,

$$m'_{p-2,p-1} = \frac{\sinh(p-2)\phi}{\sinh p\phi}$$
 $m'_{p-1,p-1} = \frac{\sinh(p-1)\phi}{\sinh p\phi}$

$$m'_{p,p} = rac{\sinh(p-1)\phi}{\sinh p\phi}$$
 $m'_{p+1,p} = rac{\sinh(p-2)\phi}{\sinh p\phi}$

Determination of $m'_{3p-2,3p-2}$ and $m'_{3p-1,3p-1}$

out we can write down the equations that arise from the last column. Thus the elements of the last column of M'_{33} by x_i , i = 1, 2, ..., p, and multiplying last element of its last column. Since we know that $M_{33}M'_{33}=I$ we denote The element $m'_{3p-2,3p-2}$ belongs to the block M'_{33} and specifically it is the

$$2\cosh\phi x_{1} - x_{2} = 0$$

$$-x_{1} + 2\cosh\phi x_{2} - x_{3} = 0$$

$$-x_{p-2} + 2\cosh\phi x_{p-1} - x_{p} = 0$$

$$-2x_{p-1} + 2\cosh\phi x_{p} = 1$$

||

or, equivalently,

$$x_0 = 0 (40)$$

$$-x_{i-1} + 2\cosh\phi x_i - x_{i+1} = 0 \quad i = 1, \dots, p$$
 (41)

$$-x_{p-1} + x_{p+1} = 1 (42)$$

satisfy them. the general equation for i=1 and i=p and requiring that x_0 and x_{p+1} (42) can be regarded as boundary conditions which are obtained by applying Equation (41) is the general difference equation, whereas equations (40) and

The characteristic equation of (41) is

$$\rho^2 - (2\cosh\phi)\rho + 1 = 0$$

and as we have already seen in section 4.4.1 the general solution of (41) is given by

$$x_i = c_1 e^{i\phi} + c_2 e^{-i\phi}$$

Applying now the boundary condition (40) we have

$$x_0 = 0 \iff c_1 + c_2 = 0 \iff c_2 = -c_1$$

which makes the general solution of (41) be as follows

$$x_i = c_1 e^{i\phi} - c_1 e^{-i\phi} = 2c_1 \sinh i\phi$$
 (43)

If we apply (42) we have

$$-x_{p-1} + x_{p+1} = 1 \iff$$

$$-2c_1 \sinh(p-1)\phi + 2c_1 \sinh(p+1)\phi = 1 \iff$$

$$c_1 = \frac{1}{2 \sinh(p+1)\phi - 2 \sinh(p-1)\phi}$$

expression From (43) we can obtain all the elements of the last column of M'_{33} from the

$$x_i = \frac{\sinh i\phi}{\sinh(p+1)\phi - \sinh(p-1)\phi}$$

So,

$$m'_{3p-2,3p-2} = \frac{\sinh p\phi}{\sinh(p+1)\phi - \sinh(p-1)\phi}$$

element of the first column of M'_{44} is the same as the last element of the last M'_{33} and M'_{44} are also centro-symmetric to each other. Therefore, the first symmetric to each other and as we saw in section 4.4.1 we can deduce that The element $m'_{3p-1,3p-1}$ belongs to the block M'_{44} and specifically it is the first element of its first column. The matrices M_{33} and M_{44} are centrocolumn of M'_{33} . Consequently,

$$m'_{3p-1,3p-1} = \frac{\sinh p\phi}{\sinh(p+1)\phi - \sinh(p-1)\phi}$$

Determination of $m'_{3p-2,p-1}$, $m'_{3p-2,p}$, $m'_{3p-1,p-1}$ and $m'_{3p-1,p}$

If we use the equations (18)–(21) we have

(18)
$$\iff m'_{3p-2,p-1} = a \frac{\sinh(p-2)\phi - 4\sinh(p-1)\phi}{\sinh(p+1)\phi - \sinh(p-1)\phi}$$

(19)
$$\iff m'_{3p-2,p} = -(1-a)\frac{\sinh(p-2)\phi - 4\sinh(p-1)\phi}{\sinh(p+1)\phi - \sinh(p-1)\phi}$$

(20)
$$\iff m'_{3p-1,p-1} = -(1-a)\frac{\sinh(p-2)\phi - 4\sinh(p-1)\phi}{\sinh(p+1)\phi - \sinh(p-1)\phi}$$

(21)
$$\iff m'_{3p-1,p} = a \frac{\sinh(p-2)\phi - 4\sinh(p-1)\phi}{\sinh(p+1)\phi - \sinh(p-1)\phi}$$

Elements of the Matrix T: Second Approach

If we use the equations (36)–(39) we have

(36)
$$\iff t_{3p-2,3p-2} = \frac{(a+b-1)(\sinh(p-2)\phi - 4\sinh(p-1)\phi) + 3a\sinh p\phi}{\sinh(p+1)\phi - \sinh(p-1)\phi}$$

(37)
$$\iff t_{3p-2,3p-1} = \frac{(a-b)(\sinh(p-2)\phi - 4\sinh(p-1)\phi) - 3(1-a)\sinh p\phi}{\sinh(p+1)\phi - \sinh(p-1)\phi}$$

$$(38) \iff t_{3p-1,3p-2} = \frac{(a-b)(\sinh(p-2)\phi - 4\sinh(p-1)\phi) - 3(1-a)\sinh p\phi}{\sinh(p+1)\phi - \sinh(p-1)\phi}$$

$$(39) \iff t_{3p-1,3p-1} = \frac{(a+b-1)(\sinh(p-2)\phi - 4\sinh(p-1)\phi) + 3a\sinh p\phi}{\sinh(p+1)\phi - \sinh(p-1)\phi}$$

4.5.5 Optimum Values of a and b

(11). For this we successively have Now we can try to find the solutions of the system of equations (10) and

(10)
$$\iff$$
 $(a+b-1)(\sinh(p-2)\phi - 4\sinh(p-1)\phi) + 3a\sinh p\phi = 0$ (44)

$$(11) \iff [(a+b-1)(\sinh(p-2)\phi - 4\sinh(p-1)\phi) + 3a\sinh p\phi]^{2} - [(a-b)(\sinh(p-2)\phi - 4\sinh(p-1)\phi) - 3(1-a)\sinh p\phi]^{2} - [(a-b)(\sinh(p-2)\phi - 4\sinh(p-1)\phi) - 3(1-a)\sinh p\phi]^{2} = 0$$

$$\iff [(2a-1)(\sinh(p-2)\phi - 4\sinh(p-1)\phi) + 3(2a-1)\sinh p\phi] = 0$$

$$\iff [(2a-1)(\sinh(p-2)\phi - 4\sinh(p-1)\phi) + 3\sinh p\phi] = 0$$

$$\iff (2a-1)[(2b-1)(\sinh(p-2)\phi - 4\sinh(p-1)\phi) + 3\sinh p\phi] = 0$$

$$\iff (2a-1)[(2b-1)(\sinh(p-2)\phi - 4\sinh(p-1)\phi) + 3\sinh p\phi] = 0$$

$$\iff (2a-1)[(2b-1)(\sinh(p-2)\phi - 4\sinh(p-1)\phi) + 3\sinh p\phi] = 0$$

$$\Rightarrow b = \frac{\sinh(p-2)\phi - 4\sinh(p-1)\phi - 3\sinh p\phi}{2(\sinh(p-2)\phi - 4\sinh(p-1)\phi)}$$

$$(45)$$

timum values for a and b are Using either solution of equation (45) into (44) we find out that the op-

$$a = \frac{1}{2}$$
 and $b = \frac{\sinh(p-2)\phi - 4\sinh(p-1)\phi - 3\sinh p\phi}{2(\sinh(p-2)\phi - 4\sinh(p-1)\phi)}$

REMARK

above the four elements $t_{3p-2,3p-2}$, $t_{3p-2,3p-1}$, $t_{3p-1,3p-2}$, $t_{3p-1,3p-1}$ of T become zero and, therefore, $T^2=0$! Again, as in the first approach, in the absence of round-off errors the exact solution of the linear system will obtained after two iterations. In this case it is also observed that for the optimum values of a and b ove the four elements $t_{3p-2,3p-2}$, $t_{3p-2,3p-1}$, $t_{3p-1,3p-2}$, $t_{3p-1,3p-1}$ of T

5 The Poisson Equation

ied in the previous two chapters. The Poisson equation was the very first here. The PDE problem for the Poisson equation is given by part of our study and so we present very briefly the corresponding results The Poisson equation is a particular case of the Helmholtz equation stud-

$$-u'' = f \quad \text{in} \quad \Omega \equiv (0, 1)$$

$$u(0) = \alpha \quad \text{and} \quad u(1) = \beta$$

$$(46)$$

where α and β are the given boundary values.

obtained from the ones in the the previous case adopting limiting processes d in the matrices M will be 2, all the results in this present case can also be letting $c \to 0^+$. from the Helmholtz one (4) with c = 0, and therefore the diagonal element Since, as was already mentioned, the Poisson equation can be obtained

Determination of a and b: First Approach

Again, the elements $t_{3p-2,3p-2}$, $t_{3p-2,3p-1}$, $t_{3p-1,3p-2}$ and $t_{3p-1,3p-1}$ will be given by equations (22)–(25).

What we now need are the necessary elements of the matrix M'

Determination of the Elements of the Matrix M'

column of the product $M_{11}M'_{11} = I$, we have pute these elements we write down the equations that correspond to the last The elements $m'_{p-2,p-1}$ and $m'_{p-1,p-1}$ belong to the block M'_{11} . To com-

$$2x_{1} - x_{2} = 0$$

$$-x_{1} + 2x_{2} - x_{3} = 0$$

$$\vdots$$

$$-x_{p-3} + 2x_{p-2} - x_{p-1} = 0$$

$$-x_{p-2} + 2x_{p-1} = 1$$

or, equivalently,

$$x_0 = 0 (47)$$

$$-x_{i-1} + 2x_i - x_{i+1} = 0 \quad i = 1, \dots, p-1$$
 (48)

$$x_p = 1 (49)$$

Again, the boundary conditions (47) and (49) are obtained by applying the general equation for i=1 and i=p-1 and demanding that x_0 and x_p satisfy them.

The characteristic equation of the general difference equation (48) is

$$\rho^2 - 2\rho + 1 = 0$$

whose solutions are

$$\rho_1 = \rho_2 = 1$$

Thus the general solution of (48) is

$$i = c_1 \rho_1^i + c_2 i \rho_1^i = c_1 1^i + c_2 i 1^i$$

= $c_1 + c_2 i$

Applying the boundary condition (47) we have

$$x_0 = 0 \iff c_1 + c_2 = 0 \iff c_1 = 0$$

which makes the general solution of (48) be given by

$$x_i = c_2 i \tag{50}$$

If we now apply (49) we have

$$x_p = 1 \iff c_2 p = 1 \iff c_2 = \frac{1}{p}$$

expression From (50) we can obtain all the elements of the last column of M'_{11} from the

$$x_i = \frac{i}{p}$$

 S_{0}

$$m'_{p-2,p-1} = \frac{p-2}{p}$$
 $m'_{p-1,p-1} = \frac{p-1}{p}$

corresponding expressions as $\phi \to 0^+$. Thus we have we have already found in section 4.4, and determining the limits of the case we can find all the elements we need, by using the various expressions elements of M' we need. However, at this point we can comment that in our We could continue in the same way and show how we could find all the

$$m'_{3p-2,p-1} = \frac{a}{2}(-3p+2)$$

$$m'_{3p-2,p} = -\frac{1-a}{2}(-3p+2)$$

$$m'_{3p-2,3p-2} = \frac{p}{2}$$

$$m'_{3p-1,p-1} = -\frac{1-a}{2}(-3p+2)$$

$$m'_{3p-1,p} = \frac{a}{2}(-3p+2)$$

$$m'_{3p-1,3p-1} = \frac{p}{2}$$

5.1.2 Elements of the Matrix T: First Approach

If we use equations (22)–(25) we have

(22)
$$\iff t_{3p-2,3p-2} = a+b-1$$

(23) $\iff t_{3p-2,3p-1} = a-b$
(24) $\iff t_{3p-1,3p-2} = a-b$
(25) $\iff t_{3p-1,3p-1} = a+b-1$

5.1.3 Optimum Values of a and b

taneously. We will try to see if we can make equations (10) and (11) be satisfied simul-

$$(10) \iff a+b-1 = 0 \tag{51}$$

(11)
$$\iff (a+b-1)^2 - (a-b)^2 = 0 \iff (2a-1)(2b-1) = 0$$

 $\iff a = \frac{1}{2} \text{ or } b = \frac{1}{2}$ (52)

timum values for a and b are From the system of equations (52) and (51) we readily find that the op-

$$a = \frac{1}{2} \quad \text{and} \quad b = \frac{1}{2}$$

independent of ϕ . for the optimal ones for a and b in the case of Helmholtz equation were We remark that this result was somehow expected since the values found

Determination of a and b: Second Approach

The elements $t_{3p-2,3p-2}$, $t_{3p-2,3p-1}$, $t_{3p-1,3p-2}$ and $t_{3p-1,3p-1}$ will be given again by equations (36)–(39).

Determination of the Elements of the Matrix M

of the previous approach, we do not need to find the necessary elements of in section 5.1.1 instead. their inverse matrices again. We can refer to the corresponding expressions As the blocks M_{11} M_{22} M_{33} and M_{44} are identically the same with the ones

Elements of the Matrix T: Second Approach

If we use the equations (36)–(39) we have

(36)
$$\iff t_{3p-2,3p-2} = \frac{(a+b-1)(-3p+2) + 3ap}{2}$$

(37)
$$\iff t_{3p-2,3p-1} = \frac{(a-b)(-3p+2) - 3(1-a)p}{2}$$

(38)
$$\iff t_{3p-1,3p-2} = \frac{(a-b)(-3p+2) - 3(1-a)p}{2}$$

(39)
$$\iff t_{3p-1,3p-1} = \frac{(a+b-1)(-3p+2) + 3ap}{2}$$

5.2.3 Optimum Values of a and b

If we try to find the solution of (10) and (11) we have

(10)
$$\iff$$
 $(a+b-1)(-3p+2)+3ap=0$ (53)

(11)
$$\iff [(a+b-1)(-3p+2) + 3ap]^2 - [(a-b)(-3p+2) - 3(1-a)p]^2 = 0$$

 $\iff (4a-2)(4b-6bp+6p-2) = 0$
 $\iff a = \frac{1}{2} \text{ or } b = \frac{3p-1}{3p-2}$ (54)

timum values for a and b are The solution to the system of equations (54) and (53) gives that the op-

$$a = \frac{1}{2}$$
 and $b = \frac{3p-1}{3p-2}$

7 Conclusions

ing linear systems are obtained after two iterations. 4.5, in the absence of round-off errors, the exact solutions of the correspondproaches was achieved. More specifically, as was remarked in sections 4.4, best possible asymptotic convergence of the iterative schemes for both ap-From the theoretical analysis done in this work it became clear that the

order of the truncation errors) which for the grid sizes chosen should be round-off errors and the single precision arithmetic used, we observe that errors in each one of them are even better than the order of accuracy (the the solutions obtained are much better than what one would expect. However, in all of the experiments we tried and despite the presence of 10^{-3} , 10^{-4} , respectively, for the three test examples. The

results which are very close to the ones already obtained after the first one. seems to be achieved after the very first iteration. The second iteration gives The very good order of accuracy obtained in all the experiments tried

second approach. iments show that the first one seems to give slightly better results than the Out of the two approaches analyzed and studied in this work, the exper-

further research at the linear algebra level. The theoretical difficulties for the more than two subdomains and/or one dimension, an issue which is open for overcome will be of a much more difficult nature. problem. So it is fully understandable that the theoretical issues one has to this "elementary" one-dimension, two-equally-uniformly-sized-subdomaindetermination of the optimum parameters might have become obvious even at herent parallelism can be fully exploited when one moves on to considering Neumann iterations) for the two subdomains independently. Thus this inlog of the differential problem at the two half-iteration levels (Dirichlet and The way our theory was developed enables us to solve the discrete ana-

Source Code developed in Fortran 77

The linear systems were solved using routines from the Linpack Package
